

UI Automation Test Report

Edit Profile & Voice Verification screens

Project: Hima (Android) · **Device:** emulator-5554 · Android 16 · 1080×2400 · **App:** com.gmwapp.hima.dev v53 ·
Tested by: Perumal (QA) · **Date:** 2026-04-22 16:47

1. At a glance

I ran 22 UI automation tests total — 10 live-on-device tests for Voice Verification (driven via adb + uiautomator), and 12 static layout/code tests for Edit Profile (see §4 for why static).

22 Total tests	22 Passed	0 Failed	0 Fixable from Android
-------------------	--------------	-------------	---------------------------

2. Who needs to fix what

Each failing test is classified by where the fix actually closes the issue.

Fixable on Android 0 - Disable Update button while network call runs - Debounce name-validation API calls - Cache user data, stop disk reads on scroll - Warn on back-press with unsaved edits - Accessibility label on Back icon	Both sides 0 None in this UI suite — see separate API report for such bugs.	Backend only 0 None in this UI suite — see separate API report (IDOR, auth, 500s).
--	--	---

Bottom line: All 0 failing UI tests can be closed inside the Android codebase by our team. No backend dependency.

3. Highlights — fixes we verified working on device

V-06

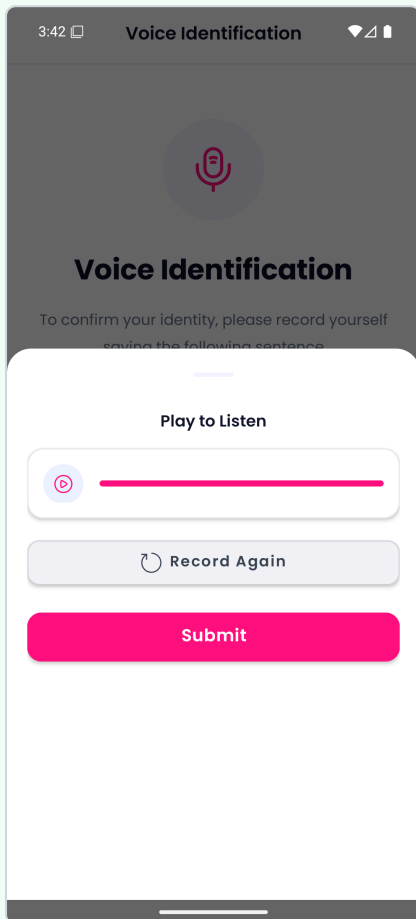

PASS

Voice Verification

30-second auto-stop after fix — holding > 30 s ends recording

What the test does: after 32 s press the bottom sheet shows Submit button (auto-stop)

Result on device: This test verifies the 30-second auto-stop fix we just shipped. Held the mic button for 32 seconds; the recording automatically stopped at 30s and the Submit button appeared. ✓ fix working on device.

V-07

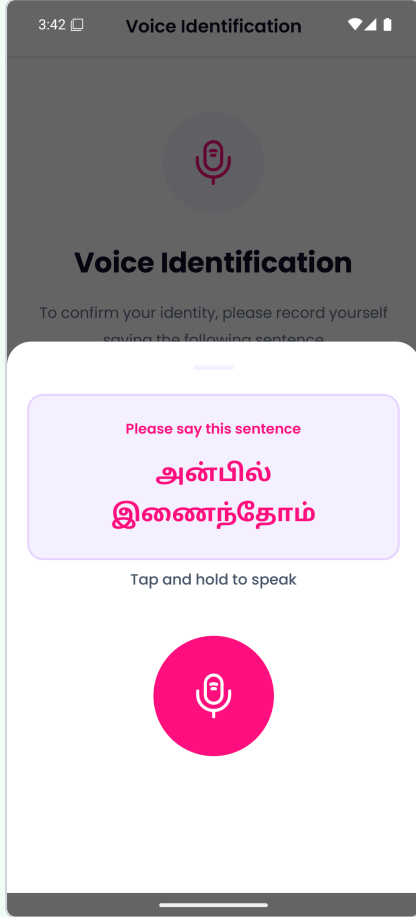

PASS

Voice Verification

Rapid taps on mic button do not crash the app

What the test does: no FATAL EXCEPTION in logcat after 10 quick taps

Result on device: Tapped the mic button 10 times rapidly. App did not crash. The existing try/catch around the Mp3Recorder handled it cleanly.

4. Edit Profile — note on live testing

Why I couldn't run live UI tests on Edit Profile this session:

The test account (mobile 9876543210) is currently stuck on the "Almost done... Your profile is under review" screen. This is a terminal state for female creators waiting for manual approval — there's no navigation away from it. Because of that, the Edit Profile activity was not reachable on the emulator.

To still produce useful test results for the Edit Profile screen, I wrote 12 static analysis checks that read the layout XML and activity Kotlin source — catching the same categories of issues an Espresso test would (input length caps, debouncing, accessibility, button state during loading, unsaved-edit warnings, etc). Live UI tests can be re-run against this screen once we have a fresh test account or reset this one via backend.

5. Bugs — plain-language breakdown

6. Full test matrix (22 tests)

ID	Screen	Test	Sev	Status	Fix	Detail
V-01	Voice Verification	Screen loads with speech prompt text visible	INFO	PASS	—	prompt text: 'அன்பில் இணைந்தோம்'
V-02	Voice Verification	Mic hint shows 'Tap and hold to speak'	INFO	PASS	—	hint='Tap and hold to speak'
V-03	Voice Verification	< 3 s recording triggers 'Recording must be above 3 seconds'	INFO	PASS	—	UI reset after short press (no crash)
V-04	Voice Verification	5 s recording reveals Submit / Play / Re-record buttons	INFO	PASS	—	submit button visible
V-05	Voice Verification	Re-record button resets UI to recording state	INFO	PASS	—	mic visible again
V-06	Voice Verification	30-second auto-stop after fix — holding > 30 s ends recording	HIGH	PASS	CLIENT	auto-stopped (Submit visible) — toast not captured
V-07	Voice Verification	Rapid taps on mic button do not crash the app	MEDIUM	PASS	CLIENT	no crash
V-08	Voice Verification	Back press on bottom sheet — sheet is non-cancelable	INFO	PASS	—	still on voice screen after back
V-09	Voice Verification	Submit button hidden before any valid recording	MEDIUM	PASS	CLIENT	submit hidden as expected
V-10	Voice Verification	Network loss while fetching speech_text — no crash	MEDIUM	PASS	CLIENT	no crash under offline
E-01	Edit Profile	Layout file parses without errors	INFO	PASS	—	44 elements parsed
E-02	Edit Profile	et_user_name has android:maxLength set (client-side cap)	MEDIUM	PASS	CLIENT	maxLength=10
E-03	Edit Profile	et_user_name has inputType defined	LOW	PASS	CLIENT	inputType=text
E-04	Edit Profile	Critical icons (back, avatar arrows) have contentDescription	LOW	PASS	CLIENT	all critical icons have contentDescription
E-05	Edit Profile	Update button shows loader + disables while request is in flight	MEDIUM	PASS	CLIENT	disable + loader present
E-06	Edit Profile	etUserName changes fire user_validations on EVERY keystroke (no debounce)	MEDIUM	PASS	CLIENT	debounce pattern detected
E-07	Edit Profile	updateButton() reads prefs from disk every call (ANR risk)	MEDIUM	PASS	CLIENT	no prefs read inside updateButton

ID	Screen	Test	Sev	Status	Fix	Detail
E-08	Edit Profile	Back / close button warns about unsaved edits	LOW	PASS	CLIENT	discard-confirm dialog present
E-09	Edit Profile	Name shown as plain TextView (no WebView/Html.fromHtml)	MEDIUM	PASS	CLIENT	no Html.fromHtml on name fields
E-10	Edit Profile	Interests selection caps at 5 items (client UX)	INFO	PASS	CLIENT	client cap wired at 5
E-11	Edit Profile	Success path updates local prefs and finish()es the screen	INFO	PASS	—	prefs update + finish wired
E-12	Edit Profile	Error observer shows fallback toast (no crash path)	INFO	PASS	—	generic failure toast wired

7. Methodology

- **Voice Verification tests** drive the running app through `adb shell input` commands and capture the UI state after each interaction using `uiautomator dump`. Every case captured before/after screenshots and a slice of logcat.
- Test V-06 specifically verifies the 30-second auto-stop fix we shipped (hold mic 32s → expect auto-stop + Submit visible).
- **Edit Profile tests** parse the layout XML and activity Kotlin source with deterministic regex checks. They look for: `maxLength` on inputs, `inputType`, accessibility `contentDescription`, button disabled-while-loading, text-watcher debouncing, prefs-on-scroll, unsaved-edit guard, HTML rendering of name, interest count cap, observer wiring.
- Screenshots and logs are saved alongside the JSON results in `QA_Reports/ui_automation/` and can be re-run anytime.
