

# Hima — Support Bot

AI ticket-deflection feature — **how it works**, configuration, and operations

Innovfix Pvt. Ltd. · Hima App · v1 · 2026-07-17 · Backend: Laravel (demo\_hima / hima-admin-panel) · App: Android (hima\_app)

**What it is, in one line.** A guided in-app chat that sits **in front of** the existing ticket system: it asks the user 3–4 questions, reads **their own live account data**, answers, and only creates a support ticket if the user says the answer did not help. The goal is to stop the repeat-contact tickets (the average user raised ~2 per month) at the source — without ever making a false statement about someone's money or account.

## 1. The user flow

| Step                   | Screen                                                            | Notes                                                                                                        |
|------------------------|-------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| 0 · Language           | "Choose your language" (prompt in English, all 11 options)        | Applies to <b>this conversation only</b> — does not change the profile language / matching.                  |
| 1 · Category           | 5 categories, volume-ordered                                      | Calls · Earnings/Withdrawal · Coins/Recharge · Account/Profile · Something else.                             |
| 2 · Sub-category       | The category's sub-options + "My issue isn't listed"              | Chips are <b>server-driven</b> — the app renders labels and posts keys; it knows nothing about the taxonomy. |
| 3 · One detail         | A sub-category-specific question (optional, with Skip where safe) | e.g. "double charge" asks for a date/time; the answer genuinely needs it.                                    |
| 4 · Answer             | Typing → the AI's answer                                          | Only this step is slow. The bot has already read the user's data before replying.                            |
| 5 · Did this solve it? | [Yes, solved] · [No, still need help]                             | <b>Yes</b> → close, <b>no ticket</b> . <b>No</b> → one more attempt, then a human.                           |

**Yes vs No — the whole point.** "Yes" closes the chat and **creates no ticket row** (a deflected issue must not appear in tickets, or deflection is unmeasurable). "No" buys **one** second, different answer; a second "No" creates a ticket for a human, pre-tagged and with the bot's diagnostics attached. There is no third attempt.

## 2. How it stays accurate (why it can be trusted with money)

- **Reads live data via fixed, read-only tools** — never free-form SQL. Eight tools: account summary, recent calls, call detail, recharge history, coin ledger, withdrawal history, earnings summary, block status.
- **The user is structural, not a parameter.** The logged-in user id is fixed on the server; it appears in **no** tool the model can call, so the model cannot express "look at another user's data" (closes IDOR by construction).
- **Grounding guard.** Every number in a reply (₹ amounts, coins, order ids, times) must be a value a tool actually returned. Any invented number → the answer is discarded and the issue is escalated.
- **Skip-AI on money.** For sensitive/redirect money categories the model is never called at all — a human takes it directly, so money cannot be hallucinated about.
- **Recharge crediting is never asserted as fact.** transactions has no gateway/order link and add\_coins also covers admin grants, so a same-size credit near a payment is only an **indication**, not proof. The bot states **payment\_status** (paid / not completed) as fact, reports any nearby credit as a labelled possibility with its confidence, and routes every paid recharge to a human to verify against the gateway dashboard — it never claims "you were credited" or "money taken, no coins".
- **Fail closed.** If a tool cannot read the user's data (DB/replica down), the bot escalates to a human rather than answering around the gap. On prod, reads use a replica; if the replica lags, it falls back to the primary so it never states stale data.
- **Never promises** a refund, credit or timeline; **never deletes** an account — a delete request is treated as a symptom and probed.

## 3. Configuration & kill-switches (ops)

| Setting                                              | Where                       | Effect                                                                                                                                                                                                           |
|------------------------------------------------------|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>support_bot_enabled</code>                     | <code>gateway_config</code> | <b>Master kill-switch.</b> When set to <code>0</code> , the app shows the old raise-ticket form and in-flight sessions escalate to a human instead of calling the model. Fails <b>closed</b> (unreadable = off). |
| <code>support_bot_model</code>                       | <code>gateway_config</code> | The model id (default Claude Sonnet). Deliberately separate from the ticket-answering model.                                                                                                                     |
| <code>support_bot_subcategories</code>               | <code>gateway_config</code> | CSV allowlist of sub-categories (empty = all). An off-list topic routes straight to a human — turn the bot on one topic at a time as shadow data proves each playbook.                                           |
| <code>known_issue_banner</code>                      | <code>gateway_config</code> | When set, shown first during a platform incident — deflects the duplicate flood before the menu.                                                                                                                 |
| <code>support_hours_start</code> / <code>_end</code> | <code>gateway_config</code> | Agent shift (default 4 PM–12 AM IST) for the out-of-hours "when we'll look" ETA.                                                                                                                                 |
| <code>SUPPORT_BOT_READ_CONNECTION</code>             | <code>.env</code>           | Read replica for tool queries on prod (empty on demo). Lag-guarded.                                                                                                                                              |
| <code>SUPPORT_BOT_SESSION_CEILING</code>             | <code>.env</code>           | Hard per-session deadline (25s) — under PHP's execution limit; the app waits longer so it always gets the definitive answer.                                                                                     |
| <code>SUPPORT_BOT_TOKEN_BUDGET</code>                | <code>.env</code>           | Hard per-session cost ceiling; exceeding it escalates rather than spending more.                                                                                                                                 |

**Answers are ops-editable without a deploy.** The per-sub-category playbooks live in `ai_reference_faqs` (already per-language, already an admin UI). The Yes/No taps are a free labelled dataset — a sub-category below ~40% "Yes" is a broken playbook or a real product bug.

#### 4. Endpoints (all `auth:api`, no `user_id` ever accepted from the client)

| Endpoint                          | Purpose                                                                                                                     |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <code>support_bot_start</code>    | Opens/*resumes* a session; returns language chips + any known-issue banner. Checks for a pending escalated ticket up front. |
| <code>support_bot_reply</code>    | Walks the tree, then answers. One request per session at a time (locked).                                                   |
| <code>support_bot_feedback</code> | "Did this solve it?" — the only thing that resolves or escalates. Runs the second attempt.                                  |
| <code>support_bot_session</code>  | Rebuilds a session reopened after the app was killed (transcript + current step).                                           |
| <code>support_bot_attach</code>   | Optional file on the ticket the bot raised (image/video/audio, ≤5MB). Serialised per ticket.                                |

#### 5. Rollout & what to watch

- **Demo-first, always.** Everything is verified on `demohima.himaapp.in` before prod. Prod goes on an explicit go, staged by sub-category allowlist and user %.
- **Fallback is safe.** With the kill-switch off, or on any start failure, the user gets the old form — the support channel is never removed behind the LLM.
- **Weekly metrics:** per-sub-category Yes-rate · grounding-guard trips (should be ~0) · p50/p95 latency · tokens/session · **48h re-contact rate** · and the north star: **tickets per user per month**.

**Design guardrail — "calls not coming" (the #1 driver) is a real product bug the bot cannot fix.** The bot reads the data and escalates; it does **not** troubleshoot ("check your network"), which reads as being fobbed off by a robot. Its deflection target there is near-zero **by design** — track it as a product-bug signal, not a deflection KPI.

#### 6. Technical inventory

##### Controllers, services & models

| Component                                                                                                                            | Type       | Responsibility                                                                                               |
|--------------------------------------------------------------------------------------------------------------------------------------|------------|--------------------------------------------------------------------------------------------------------------|
| <code>SupportBotController</code>                                                                                                    | Controller | The 5 endpoints; step machine; session lock; kill-switch guard; escalation + attach.                         |
| <code>SupportBotService</code>                                                                                                       | Service    | The model tool-loop; deadline budget; grounding guard; escalate control-flow.                                |
| <code>SupportToolRunner</code>                                                                                                       | Service    | The 8 read-only tools; user-scoped by constructor; replica-lag guard; recharge matcher.                      |
| <code>TicketCreationService</code>                                                                                                   | Service    | Turns a session into a human ticket; per-user advisory lock; canonical-phrase routing.                       |
| <code>SupportBotSafetyGate</code>                                                                                                    | Service    | Safety-only refusal (harassment/abuse/minors/self-harm/report).                                              |
| <code>SupportHours</code> · <code>SupportBotStrings</code> · <code>SupportBotTaxonomy</code> · <code>Prompts\SupportBotPrompt</code> | Service    | Shift/out-of-hours ETA · 11-language strings · categories & canonical phrases · the versioned system prompt. |
| <code>SupportBotSession</code>                                                                                                       | Model      | Per-conversation state (step, language, transcript, last_render, telemetry).                                 |
| <code>Ticket</code> · <code>Users</code>                                                                                             | Model      | Existing models; bot writes tickets with <code>source=bot</code> ; reads <code>Users</code> for scope.       |

### Tables (reads unless noted)

| Table                                                                                                                                                                                       | Use                                                                                                    |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|
| <code>support_bot_sessions</code> (RW)                                                                                                                                                      | Session state + telemetry. New table; migrations are <code>hasColumn</code> -guarded.                  |
| <code>tickets</code> (RW)                                                                                                                                                                   | Human tickets on escalation (bot columns: source, sub_category, language, bot_session_id, screenshot). |
| <code>gateway_config</code>                                                                                                                                                                 | Kill-switch, model id, known-issue banner, support hours. Runtime, cross-node.                         |
| <code>users</code> · <code>user_calls</code> · <code>transactions</code> · <code>coins</code> · <code>cashfree_payments</code> · <code>phonepe_payments</code> · <code>blocked_users</code> | Read-only tool sources (account, calls, ledger, packs, payments, block status).                        |
| <code>ai_reference_faqs</code>                                                                                                                                                              | Per-language answer playbooks (admin-editable, no deploy).                                             |

### External providers · jobs

- **OpenRouter** → **Claude Sonnet** (via `gateway_config.support_bot_model`) — the only external call; synchronous, budgeted (25s ceiling, token cap), keyed by `openrouter_api_key`.
- **Cashfree / PhonePe** — **read-only**, via their payment tables; the bot never calls the gateways.
- **Jobs/cron**: the bot adds **none** — every request is synchronous. Escalated tickets flow through the existing ticket pipeline. No queue worker to run or monitor.

### Failure modes & handling (all fail toward a human, never a wrong answer)

| Failure                                   | Handling                                                                                                                                       |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| Model timeout / API error / round limit   | Escalate to a human ticket (deadline budget → <code>escalate</code> ).                                                                         |
| Tool can't read data (DB/replica down)    | Fail closed — <code>escalate ( tool_error )</code> , never answer around the gap.                                                              |
| Replica lagging                           | Read from the primary for that session.                                                                                                        |
| Ungrounded number in the reply            | Discard the answer, escalate (grounding guard).                                                                                                |
| Recharge crediting unprovable             | Report <code>payment_status</code> only; route to a human to verify (no credited/no-coins claim).                                              |
| Kill-switch off (start or mid-session)    | Old raise-ticket form / escalate the in-flight session; no model call.                                                                         |
| Duplicate ticket race / concurrent attach | Per-user & per-ticket MySQL advisory locks (cross-node).                                                                                       |
| Node-local attachment storage             | <b>Known operational risk</b> — an upload may be unavailable from another node until ticket storage is moved to a shared disk (platform task). |

### Rollback

- **Instant**: set `gateway_config.support_bot_enabled=0` — users get the old form, in-flight sessions escalate. No deploy, cross-node.

- **All users, staged by topic:** the bot is on for every user when enabled (no per-user gating, by owner decision). Turn it on one topic at a time with `support_bot_subcategories` (a `gateway_config` allowlist; empty = all topics) — off-list topics route straight to a human.
- **Schema:** all new columns are additive and `hasColumn`-guarded; reverting the branch leaves the tables harmless. No destructive migration.

## 7. QA test cases (formal — run before release)

**How to run.** Each case has a stable ID ( `SB-###` ), priority (P1 blocks release), module reference, preconditions and test data, numbered steps, and the expected result. Fill the **Execution** row: mark Pass/Fail, attach Evidence (screen recording / DB row), log a Defect ID on failure, and record the Retest result. **Build/role/data:** run on the Play/Internal build, as a **male caller** and a **female creator**, on WiFi and mobile data, unless a case says otherwise.

### SB-001 P1 Guided flow, end to end Module: Support Bot / Flow · Ref §1

|              |                                                                                                                                                                                                                                                                                                                            |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Precondition | Bot enabled ( <code>support_bot_enabled=1</code> ); test account has no open escalated ticket.                                                                                                                                                                                                                             |
| Test data    | Any account; pick category "Calls".                                                                                                                                                                                                                                                                                        |
| Steps        | <ol style="list-style-type: none"> <li>1. Open Help → Support.</li> <li>2. Observe the language prompt; select one.</li> <li>3. Select a category, then a sub-category.</li> <li>4. Answer the follow-up (or Skip if offered).</li> <li>5. Wait for the answer, then observe the "Did this solve it?" controls.</li> </ol> |
| Expected     | Steps appear in order language → category → sub-category → optional detail → answer → Yes/No. "My issue isn't listed" is present at the sub-category step. No crash; each step responds <2s except the answer.                                                                                                             |

Execution: ☐ Pass ☐ Fail    Evidence: \_\_\_\_\_    Defect#: \_\_\_\_\_    Retest: \_\_\_\_\_

### SB-002 P1 Language & script consistency Module: Support Bot / Language · Ref §1.0

|           |                                                                                                                                                                                                                                           |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Test data | Select English at step 0; then type the free-text detail in Tanglish ("calls varala").                                                                                                                                                    |
| Steps     | <ol style="list-style-type: none"> <li>1. Select a language and complete the flow to an answer.</li> <li>2. Read every bot message for language consistency.</li> <li>3. At the free-text step type romanised (Tanglish) text.</li> </ol> |
| Expected  | The whole conversation stays in the chosen language (no mid-chat switch). The answer mirrors the user's script (Tanglish in → Tanglish out), not native Tamil.                                                                            |

Execution: ☐ Pass ☐ Fail    Evidence: \_\_\_\_\_    Defect#: \_\_\_\_\_    Retest: \_\_\_\_\_

### SB-003 P1 Deflection creates no ticket Module: Support Bot / Deflection · Ref §1.5

|              |                                                                                                                                                                                   |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Precondition | DB/admin access to check the <code>tickets</code> table.                                                                                                                          |
| Steps        | <ol style="list-style-type: none"> <li>1. Complete a flow to an answer.</li> <li>2. Tap "Yes, solved".</li> <li>3. Query <code>tickets</code> for this user/timestamp.</li> </ol> |
| Expected     | Conversation closes; optional rating shows; <b>no new row</b> in <code>tickets</code> .                                                                                           |

Execution: ☐ Pass ☐ Fail    Evidence: \_\_\_\_\_    Defect#: \_\_\_\_\_    Retest: \_\_\_\_\_

### SB-004 P1 Escalation: second attempt then human Module: Support Bot / Escalation · Ref §1.5

|          |                                                                                                                                                                                                                                 |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Steps    | <ol style="list-style-type: none"> <li>1. Reach an answer; tap "No, still need help".</li> <li>2. Observe the second attempt (a different answer).</li> <li>3. Tap "No" again.</li> <li>4. Open the ticket in admin.</li> </ol> |
| Expected | Exactly one second attempt (different content). A ticket is created for a human ( <code>source=bot</code> , <code>requires_manual_support=1</code> ) with the bot's diagnostics attached. No third AI attempt.                  |

Execution: ☐ Pass ☐ Fail    Evidence: \_\_\_\_\_    Defect#: \_\_\_\_\_    Retest: \_\_\_\_\_

**SB-005** **P1** **Delete-account is probed, never actioned** Module: Support Bot / Safety · Ref §2

|          |                                                                                                                                         |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------|
| Steps    | 1. Choose Account → a delete-account intent (or type "delete my account").                                                              |
|          | 2. Follow the conversation.                                                                                                             |
| Expected | The bot asks what the underlying problem is and tries to help; it never offers or performs deletion. No account is deleted or disabled. |

Execution: ☐ Pass ☐ Fail Evidence: \_\_\_\_\_ Defect#: \_\_\_\_\_ Retest: \_\_\_\_\_

**SB-006** **P1** **Resume mid-flow after app kill** Module: Support Bot / Resume · Ref §4

|          |                                                                                                              |
|----------|--------------------------------------------------------------------------------------------------------------|
| Steps    | 1. Advance to the sub-category / detail step.                                                                |
|          | 2. Force-kill the app (swipe from recents).                                                                  |
|          | 3. Reopen Help → Support.                                                                                    |
| Expected | The prior conversation is rebuilt and lands on the same step; the user does not re-answer earlier questions. |

Execution: ☐ Pass ☐ Fail Evidence: \_\_\_\_\_ Defect#: \_\_\_\_\_ Retest: \_\_\_\_\_

**SB-007** **P2** **Resume after answer / when finished** Module: Support Bot / Resume · Ref §4

|          |                                                                                                                                                             |
|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Steps    | 1. Receive an answer (Yes/No shown); kill and reopen.                                                                                                       |
|          | 2. Resolve or escalate the session; kill and reopen again.                                                                                                  |
| Expected | First reopen shows THAT answer with Yes/No (never the rejected first answer). After resolve/escalate, reopen is read-only (transcript only, no live input). |

Execution: ☐ Pass ☐ Fail Evidence: \_\_\_\_\_ Defect#: \_\_\_\_\_ Retest: \_\_\_\_\_

**SB-008** **P2** **Attachment — validation & lifecycle** Module: Support Bot / Attach · Ref §4

|              |                                                                                                                                                                                                                                                                                                                      |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Precondition | A ticket has just been raised (SB-004), so the attach option is offered.                                                                                                                                                                                                                                             |
| Test data    | A <5MB image; a >5MB video; a .txt file; a large screen-recording.                                                                                                                                                                                                                                                   |
| Steps        | 1. Attach the valid image → confirm it appears on the ticket.                                                                                                                                                                                                                                                        |
|              | 2. Attach the >5MB file → observe rejection.                                                                                                                                                                                                                                                                         |
|              | 3. Attach the .txt → observe type rejection.                                                                                                                                                                                                                                                                         |
|              | 4. Start a large upload, then rotate the screen; and separately, start one and background/kill the app.                                                                                                                                                                                                              |
|              | 5. Try to pick a second file while one is uploading.                                                                                                                                                                                                                                                                 |
| Expected     | Valid file uploads (visible on the ticket in admin). Too-large/wrong-type are rejected with a clear message and are NOT shown as accepted. Rotation mid-upload does not break the upload or crash. Killing mid-upload leaves no orphaned cache file. A second pick while uploading is blocked with a "wait" message. |

Execution: ☐ Pass ☐ Fail Evidence: \_\_\_\_\_ Defect#: \_\_\_\_\_ Retest: \_\_\_\_\_

**SB-009** **P2** **Slow-network patience** Module: Support Bot / Timeout · Ref §1.4

|           |                                                                                                                                                                    |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Test data | Throttle the network (e.g. slow 3G profile).                                                                                                                       |
| Steps     | 1. Reach the answer step on a slow connection.                                                                                                                     |
|           | 2. Repeat for the second attempt (after "No").                                                                                                                     |
| Expected  | The app waits (up to ~30s) for the definitive answer or escalation on BOTH the first and second attempts; it does not fail early or dump the user to the old form. |

|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Precondition | Ability to set <code>gateway_config.support_bot_enabled</code> .                                                                                                     |
| Steps        | 1. Set the flag to 0; open Help → Support.                                                                                                                           |
|              | 2. Set it back to 1; start a session and reach the sub-category step.                                                                                                |
|              | 3. Set it to 0 mid-session; send the next step.                                                                                                                      |
| Expected     | With the flag 0, the old raise-ticket form is shown (no bot). Flipping to 0 mid-session makes the next step escalate to a human (no AI call), with no hang or crash. |

Execution: ☐ Pass ☐ Fail Evidence: \_\_\_\_\_ Defect#: \_\_\_\_\_ Retest: \_\_\_\_\_

**SB-011** **P2** **Pending ticket & duplicate guard** Module: Support Bot / Tickets · Ref §1**Precondition** The test account already has one open escalated ticket.**Steps**

1. Open Help → Support.
2. Separately, from two devices, drive one session each to escalation at the same time.

**Expected** The user is told about the open ticket at the START (not after four questions). No duplicate ticket is created, even from two concurrent devices.**Execution:** ☐ Pass ☐ Fail **Evidence:** \_\_\_\_\_ **Defect#:** \_\_\_\_\_ **Retest:** \_\_\_\_\_**SB-012** **P1** **MONEY — recharge is verified, never invented** Module: Support Bot / Money · Ref §2 · MUST-PASS**Precondition** DB access; a creator and a male account. Verify every figure against the DB, never the reply alone.**Test data** A real ₹1–₹49 recharge; also one completed >30 min after starting the order.**Steps**

1. Ask a recharge/coins question after a real recharge.
2. Compare the bot/ticket diagnostics to the `cashfree_payments` / `phonepe_payments` and `transactions` rows.
3. Repeat for a delayed (>30 min) completion and for two close same-size purchases.

**Expected** Recharge routes to a human. Diagnostics state **payment\_status** as fact only; crediting is shown as INDICATIVE (never a definitive "you were credited" or "money taken, no coins"). A delayed credit is still matched; two close same-size purchases with one credit are marked for human review, not falsely credited. Every ₹/coin/order-id/time in any reply came from the data (no invented refund/timeline).**Execution:** ☐ Pass ☐ Fail **Evidence:** \_\_\_\_\_ **Defect#:** \_\_\_\_\_ **Retest:** \_\_\_\_\_**SB-013** **P1** **MONEY — earnings connected count** Module: Support Bot / Money · Ref §2 · MUST-PASS**Precondition** A creator account with some calls that never connected ( `started_time='00:00:00'` ).**Steps**

1. Ask an earnings question.
2. Compare the "connected calls" figure to the Recent Calls tool and the DB.

**Expected** The connected count excludes `00:00:00` (never-connected) calls and matches Recent Calls exactly.**Execution:** ☐ Pass ☐ Fail **Evidence:** \_\_\_\_\_ **Defect#:** \_\_\_\_\_ **Retest:** \_\_\_\_\_**SB-014** **P1** **SECURITY — own data only (IDOR)** Module: Support Bot / Security · Ref §4 · MUST-PASS**Precondition** Two accounts A and B; a tool to send raw API requests (Postman).**Steps**

1. As A, drive a bot session; confirm it only ever reflects A's data.
2. With A's token, call the ticket routes passing B's `user_id` / mobile number.

**Expected** The bot only ever shows A's own data. Ticket create/list use the token identity — passing B's `user_id`/mobile returns A's own tickets or 401, never B's data; unregistered vs registered numbers return identical responses (no enumeration).**Execution:** ☐ Pass ☐ Fail **Evidence:** \_\_\_\_\_ **Defect#:** \_\_\_\_\_ **Retest:** \_\_\_\_\_**SB-015** **P3** **Zoho launcher hygiene** Module: Support Bot / UI · Ref §5**Steps**

1. As a female account (launcher enabled from home), open Support and leave.
2. As a male account, open Support and leave.

**Expected** Female: the floating Zoho launcher is hidden on the bot screen and restored on exit. Male: the launcher never appears.**Execution:** ☐ Pass ☐ Fail **Evidence:** \_\_\_\_\_ **Defect#:** \_\_\_\_\_ **Retest:** \_\_\_\_\_
